Hypothesis Testing for the Binomial Distribution : ExamSolutions

If p is the probability of success and q is the probability of failure in a binomial trial, then the expected number of successes in n trials (i.e. the mean value of the binomial distribution) is $E(X) = \mu = np$ The variance of the binomial distribution is $V(X) = \sigma^2 = npq$

12. The Binomial Probability Distribution

In a binomial distribution the probabilities of interest are those of receiving a certain number of successes, r , in n independent trials each having only two possible outcomes and the same probability, p , of success. So, for example, using a binomial distribution, we can determine the probability of getting 4 heads in 10 coin tosses.

The Binomial Distribution

In binomial probability distribution, the number of 'Success' in a sequence of n experiments, where each time a question is asked for yes-no, then the boolean-valued outcome is represented either with success/yes/true/one (probability p) or failure/no/false/zero (probability $q = 1 - p$).

Binomial Distribution In Probability - Formula and Examples

With the help of the second formula, you can calculate the binomial distribution. Mean and Variance of a Binomial Distribution. Mean(μ) = np Variance(σ^2) = npq . The variance of a Binomial Variable is always less than its mean. $\therefore npq < np$. For Maximum Variance: $p=q=0.5$ and $\sigma_{max} = n/4$. Solved Example for You
