and there's probably a free eBook or two for this title. The original work is in the public domain, so most of the variations are just with formatting and the number of illustrations included in the work. However, you might also run into several copies for sale, as reformatting the print copy into an eBook still took some work. Some of your search results may also be related works with the same title.

PicBasic PRO Examples. These examples are designed to demonstrate how to use a PIC16F877 and PicBasic PRO to communicate with our modules, most of these examples use the LCD03 display module to show the results. All the modules which use the I2C bus have 1k8 pull-up resistors to 5v. You only need one set of resistors for the whole I2C bus regardless of however many I2C devices you have connected to it.

PicBasic Pro provides serial commands that read from (HSERIN) and write to (HSEROUT) the hardware serial port. These commands have several parameters that can be modified to create the required data format. These parameters default to the following data format; 8N1@2400bps (8 data bits, no parity, and 1 stop bit).

Using the Hardware Serial Port with PicBasic Pro

Experimenting with the PicBasic Pro Compiler Introduction The BASIC language has been popular since it's conception in the 1970's. One of the main reasons for this is its ease of use and ability to make a project work within a matter of hours, instead of days or weeks. But to have the ability to program a microcontroller in BASIC, is a dream ...

This chapter focuses on programming PICs in the PicBasic language. The PicBasic compiler (PBC) is designed to work with the popular 14-bit core devices. The PicBasic Pro compiler (PBPro) works with the 14-bit core, 16-bit core, and the new 18CXXX components, which do not have the page limiting memory all the other PICs have.

Simple PWM in PicBasic Pro. This is an example of pulsewidth modulation for the PIC. The value received from an analog input is used to dim an LED, using the PWM command. The LED is on RD2, and the analog in is on RA0. The PWM command has three parameters: the pin, the duty cycle (a byte), and the number of times to pulse the pin (a word).
